1. Introduction

In our previous study [1], we proposed a frequency domain adaptive antenna array (FD-AAA) algorithm for the uplink detection in the broadband single-carrier multiple access system. In this paper, we will consider imperfect channel estimation and study the performance of the proposed algorithm with the existence of channel estimation error.

2. System Model

The multi-user single-carrier uplink transmission model is shown in Fig. 1.

Fig. 1 The FD-AAA single-carrier uplink transmission.

The frequency domain representation of the received signal from the $m^{th}$ antenna on the $k^{th}$ frequency is given by

$$R_m(k) = H_m(k)S(k) + N_m(k).$$

where $H_m(k)$, $S(k)$ and $N_m(k)$ are the frequency domain channel gain, transmitted signal and noise, respectively.

AAA weight control is performed on each frequency as

$$\tilde{R}(k) = W_{FD-AAA}(k)R(k),$$

where $W_{FD-AAA}(k) = [W_{FD-AAA,0}(k), ... , W_{FD-AAA,N-1}(k)]^T$ and $R(k) = [R_0(k), ... , R_{N-1}(k)]^T$.

The frequency domain representation of the estimated channel gain can be modeled as

$$\hat{H}_m(k) = H_m(k) + \Delta H_m(k).$$

where $\Delta H_m(k)$ can be modeled as complex Gaussian distributed variable with its variance $\sigma^2_{\Delta m} = \beta \sigma^2_m$. $\sigma^2_m$ is the variance of the channel gain. It is obvious that the larger $\beta$ is, the channel estimation becomes less accurate.

3. Simulation Result

In this section, the effect of channel estimation error on the performance of the proposed FD-AAA algorithm will be studied. The parameters used in the simulation are listed in Tab. 1.

Table I Simulation Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Modulation</th>
<th>QPSK</th>

</tr>
</tbody>
</table>

The parameter $\beta$ is chosen from 0-0.1 and the signal to noise ratio (SNR) varies from 0dB to 10dB. The simulation results on the bit error rate (BER) performance versus the parameter $\beta$ are shown in Fig. 2. It can be observed that when the SNR is low (0dB), the BER performance of the FD-AAA algorithm is slightly affected by the channel estimation error. This is because that when SNR is low, the main reason that degrades the performance is the noise. And the channel estimation error will only slightly affect the performance. On the other hand, it can also be observed that when SNR increases, the performance of the FD-AAA algorithm becomes sensitive to the channel estimation error and the effect of channel estimation error becomes more significant as SNR increases. Therefore, to ensure a good performance of the FD-AAA algorithm, high accuracy channel estimation is necessary.
